Tisoid-P15502-2; Sequence=VSP 004243; PTM: The crosslinks are made of deaminated Lys.

PTM: The crosslinks are made of deaminated Lys.

DISPASE: Defects in ELN are a cause of autosomal dominant cutis laxa is a rare connective tissue disorder characterized by loose, hyperextensible skin with decreased resilience and elasticity leading to a premature aged appearance. The skin changes are often accompanied by extracutaneous manifestations, including pulmonary emphysema, bladder diverticula, pulmonary artery stenosis and pyloric stenosis. DISBASE: Haploinsufficiency of ELN may be the cause of certain cardiovascular and musculo-skeletal abnormalities observed in Williams-Beuren syndrome (WBS) [MIM:194050]. WBS is a rare
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pubmed=10942104;

Misolated supravalvular acrtic stenosis: functional haploinsufficiency
of the elastin gene as a result of nonsense-mediated decay.";
Hum. Genet. 106:577-588(2000).
-!- FUNCTION: Major structural protein of tissues such as aorta and
nuchal ligament, which must expand rapidly and recover completely.
-!- SUBUNIT: The polymeric elastin chains are cross-linked together
into an extensible 3D network.
-!- SUBCELIULAR LOCATION: Extracellular matrix of elastic fibers.
-!- ALTERNATIVE PRODUCTS:

developmental disorder and a contiguous gene deletion syndrome involving genes from chromosome band 7q11.23. DISBASE: Defects in ELN are the cause of supravalvular aortic stenosis (SVAS). [MIM:185500]. SVAS is a congenital narrowing of the ascending aorta which can occur sporadically, as an autosomal dominant condition, or as one component of Williams-Beuren
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

"Rat tropoelastin is synthesized from a 3.5-kilobase mRNA.";

J. Biol. Chem. 263:13504-13507 (1988)

-!-FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.

-!-SUBUNIT: The Polyweric elastin chains are cross-linked together into an extensible 3D network.

-!- SUBCELLOLAR LOCATION: Extracellular matrix of elastic fibers.

-!- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Mētazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

"The cysteine residues in the carboxy terminal domain of tropoelastin form an intrachain disulfide bond that stabilizes a loop structure and positively charged pocket.";

Biochem. Biophys. Res. Commun. 186:549-555(1992).

-I. FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.

-I. SUBGUIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.

-I. SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.

-I. ALTERRATIVE PRODUCTS:

Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharamacutical, veterinary and cosmetic applications, e.g. as anti-products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELZ6-36 excluding exon 26A product

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated or subsequence has been miserted so that susceptibility to proteolysis is reduced susceptibility, and can be consequence has been inserted so that susceptibility, to proteolysis is increased. The derivatives have with reduced susceptibility, and can be consed where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivative of derivatives, and other polypeptides containing tropoelastin derivative. The competitive inhibition of protease activity. The tropoelastin derivative derived protease-susceptibility sites, are useful in human or veterinary contained competition, particularly of smooth contains, as bulking agents and for inducing chemicatis. They are also useful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or protease cleavage site in tropoelastin contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 VLGGLGALGGVGIPGGVVGAGPAAAAAKAAAKAAAPGFGLVGAAGLGGLGVGGLGVPGVG 120

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, ancrectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, nootropic, antiparkinsonian, antiasthmatic and gynaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple aclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Purthemore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0

                                                                                                                                                                                    used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmacoutical, veterinary and cosmetic applications, e.g. as anti-products or hand lotions, also surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, despending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents the synthetic human tropoelastin variant SHELGelta26A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tropoelastin, derivative; SHEL-delta-26a; SHEL; proteolysis; protease; antiwrinkle; hand lotion; bulking agent; chemotaxis; proliferation; growth inhibition; peptidomimetic; lung damage; elastin; cancer;

The present sequence represents a human reduced tropoelastin derivative, consignated SHEL-delta-26a. The sequence is produced by removing exon 26a of SHEL (SHEL not defined). The protein is representative of tropoelastin cerivatives of the invention, in which a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is reduced susceptibility, and can be concact with serum or wound exudate. The tropoelastin darives provide contact with serum or wound exudate. The tropoelastin derivatives competitive inhibition of protease activity. The tropoelastin derivative derived protease-susceptibility sites, are useful in human or veterinary contact indicting chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts osteocytes, chondrocytes and platelets. Condetivatives are competitive inhibitors of the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a control sample. A reduced level is indicative of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, aldehyde dehydrogenase 6, gravin, phospholipase C epsilon, elastin, transmembrane receptor PTK7, collagen type XVIII alpha 2, type IV collagen, transmembrane receptor PTK7, collagen type XVIII alpha 1, platelet derived growth factor receptor alpha, laminin M chain, subtilisin like protein PACS4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the disease. The present sequence is human elastin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GLGGIPPAAAAKAAKYGAAGLGGVLGGAGQFPLGGVAARPGFGLSPIFPGGACLGKACGR 180

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel human polynuclectide and the encoded polypeptide. A polynuclectide of the invention may have a use in gene therapy. An oligonuclectide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynuclectide or as a probe for detecting the polynuclectide. The polynuclectides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM0159-ADM06201 encoded by the polynuclectides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tropoelastin, hIE; elastin; glycosaminoglycan; GAG-binding; medical;

                                                                                                                                                                                                                                                                                              The invention relates to a derivative or variant of human tropoelastin (HTE) having elastin-like and/or macromolecule (specifically dycosaming)tycam (GAG)-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable GAG-binding properties, pedending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELdeltamodified

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                               The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-products. The hybrid protein have controllable GAG-binding properties, peptide 26A, from hTE. The present c a bsence of a specific fragment, designated tropoelastin derivative SHEL26-36

The present sequence represents a human tropoelastin splice form. The specification describes tropoelastin derivatives, in which a subsequence contained by the succeptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be consciplibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease cutivity. The tropoelastin derivatives, and other polypeptides containing tropoelastin derivatived protease-susceptibility sites, are useful continuary medicine, cosmetics (e.g. antiwrinkle or hand continually of smooth continually or subliking agents and for inducing chemotaxis. They are also useful for proliferation or growth inhibition. particularly of smooth custoful for publishal or endothelial cells, fibroblasts, osteocytes, condrocytes and platelets. Peptidomimetics that mimic the protease conductive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or were also metastases, or to limit protease activity that causes blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              575
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      576 SSSQHLPSTPSSPRVPGALAAAKAAKYGAAVPGVLGGLGALGGVGIPGGVVGAGPAAAA 635

The present invention relates to a minimal functional unit (MFU) of human elastin polypeptide. This protein is useful in a cosmetic material or a prosthetic material such as prosthesis for blood vessel replacements, for heart valve replacement, tissue replacement, for covering burns, for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAKAAAKAAQFGLVGAAGLGGLGVGGLGVPGVGGLGGIPPAAAAKAAKYGAAGLGGVLGG 695

The invention describes a polypeptide (1) comprising a minimal comprised of at least three beta-sheet/Deta-turn structures, and at and comprised of at least three beta-sheet/Deta-turn structures, and at least one amino acid residue that participates in cross-linking, and not least one amino acid residue that participates in cross-linking, and not construct human elastin-like prostheses such as tubes for blood vessel construct human elastin-like prostheses such as tubes for blood vessel replacement, heart replacement valves and sheets for other uses such as proteins, for e.g. collagen, to provide prosthesis material that cresembles the natural structural materials of the body. MFUS modeled on resembles the natural structural materials of the body. MFUS modeled on lampin and other fibrous proteins e.g. spider silk, can be used to make contract a variety of materials, for a number of different applications, for e.g. in cords and ropes for use in parachutes and in cosmetics. Coating cynthetic prosthesis with MFUS modeled on human elastin significantly in cords in cords in parachutes and activation. The human-like MFU material is more biocompatible than other elastin containing materials. In contrast to solubilised fragments of elastin used before, an MFU is son.

Comparide of defined composition. The MFU is considerably smaller than the paractical purposes. Like other elastin preparations, the MFU is non-companied to manipulate for experimental and quantity, to handle in solution and to manipulate for experimental and quantity, to handle in structure, easier to produce or express in thrombogenic, thus providing a truly biocompatible materials and cher ribrous proteins expensed to make a variety of materials having high tensile strength, elasticity and plasticity of their parent proteins. This is the amino acid sequence of mature human cc elastin on which the MFU peptides of the invention are based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Τ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     516 AAAGLGAGIPGLGVGVGVPGLGVGAGVPGLGVGAGVPGFGAGADEGVRRSLSPELREGDP 575
spider silk; cord; rope; parachute; cosmetic; platelet binding inhibitor;
platelet activation inihibitor; non-thrombogenic; cell infiltration;
non-immunogenic; biocompatible; high tensile strength; elasticity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This invention describes a polypeptide that comprises three beta sheet/beta turn structures and that is not a naturally occurring fibrous protein. The invention also describes a prosthesis comprising an animal, metal or synthetic material, where the surface is coated with the naterial comprising the polypeptide, a cosmetic material comprising the polypeptide, a material comprising the polypeptide, a material comprising two or more polypeptides selected from (a) a polypeptide consisting essentially of a portion of the polypeptide comprising at least three beta sheet/beta turn structures, (b) a polypeptide consisting essentially of a particular comprising at least three beta turn amin acid sequence of an animal elastin comprising at least three beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptide for constructing human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing, comprises three beta sheets and three beta turns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fibrous protein; prosthesis; elastin; lamprin; spider silk protein;
blood vessel; wound; burn healing; collagen.

sheets/beta turns, (c) a polypeptide consisting essentially of a portion of lamprin comprising at least three beta sheets/beta turns, and (d) a polypeptide consisting essentially of a spider silk protein comprising at least three beta sheets/beta turns, a polypeptide having the primary structure of a portion of a naturally occurring fibrous protein and a

```
secondary structure comprising at least three beta sheets/beta turns, where each of the beta sheet/beta turn structures comprises from 3 to about 7 amino acids and the polypeptide is not a naturally occurring fibrous protein. The minimal functional unit (MFU) of the invention is useful to construct human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing. Alternatively the MFU can be co-aggregated with other proteins, for example collagen, to provide prosthesis material that resembles the natural structural materials of the body. The MFU based material is subject to infiltration of cells growing in the patient, including tissue replacement. The material is more biocompatible than other elastin containing materials proposed for prostheses.
                                                                                                                                                                                                                                                                                                                                                                                      576 SSSQHLPSTPSSPRVPGALAAAKAAKYGAAVPGVLGGLGALGGUGILGGUVGAGPAAAAA 635

Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial
                                                                                                                                                                                                                                                                                              147
                                                                                                                                                                                                                                                                                                               577

Human synthetic tropoelastin is susceptible to hydrolytic breakdown of the crosslinks. Such material may be useful in e.g. surgical applications, where the gradual loss of material over time is intended. (Updated on 25-MAR-2003 to correct PN field.)

The present invention relates to the use of an agent that promotes elastin signaling in smooth muscle cells for decreasing or preventing occlusion of a body vessel by smooth muscle cells, decreasing vascular obstruction, promoting actin stress fiber formation or actin elloymerisation, increasing F:G actin ratio in a smooth muscle cell, preventing or preventing obstructive vascular disease (e.g. restenosis), or preventing stenosis. The agent that promotes elastin signaling in smooth muscle cells is useful for decreasing or preventing occlusion of a body vessel by smooth muscle cells, decreasing vascular obstruction, promoting

activities: immunosupressive, antitheumatic, antiarthritic, osteopathic, antigout, antinflammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as rheumatoid arthritis, lupus, ankylosing spondylitis, fibrositis, fibrositis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an immune disease caused by an infectious agent. This sequence represents a protein sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic format from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ij
            patient sample containing mRNA, analysing gene expression using the that results in a gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention utther comprises: a treatment of rheumatoid arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis; identification of other than a mouse, diagnosis of rheumatoid arthritis in a mammal other than a mouse, disease or rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collageninduced arthritis; and reducing the symptoms associated with collageninduced arthritis; and reducing the symptoms associated with collageninduced arthritis; meaning the invention have the following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAKAAAKAAQFGLVGAAGLGGLGVGGLGVPGVGGLGGIPPAAAKAAKYGAAGLGGVLGG 147

07-AUG-1997;

The invention relates to a novel method for diagnosing and analysing

```
This represents the human elastin sequence containing the minimal functional unit (MFU)-1 polypeptide of the invention. This MFU-1 is a polypeptide that has at least 3 beta-sheet/ beta-turn structures, but is not a naturally occurring fibrous protein. Each beta-sheet structure has 3-7 (preferably 5-7) amino acids and the MFU polypeptide may include at least 1 amino acid that can take part in crosslinking. The polypeptide c spider silk protein. The MFU polypeptides are self-aligning peptides having the same primary structure as part of a natural fibrous protein. They are used to coat prostheses made of animal or synthetic material or metal, particularly for use as blood vessel or heart valve replacements, wound or burn dressings, or stents. They can be used in cosmetic, elastic or high-tensile strength materials, e.g. ropes or parachute cord.

Prostheses based on the MFU allow penetration of endothelial cells, so the contract of the materials, and the MFU allow penetration of endothelial cells, so the contract of the materials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      576 SSSQHLPSTPSSPRVPGALAAAKAAKYGAAVPGVLGCLGALGGVGIPGGVVGAGPAAAA 635

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     become permanent, living, tissue replacemnts. The MFU polypeptides have better biocompatibility than known elastin-based materials. They are well defined, homogeneous material and are easier to manipulate and produce than full-length elastins. They are non-thrombonomic and produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          than full-length elastins. They are non-thrombogenic and non-immunogenic. Materials can be made from 2 or more different MFU polypeptides to allow properties to be tailored for particular applications, e.g. combining the high extensibility of elastin and the high tensile strength of spider
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               516 AAAGLGAGIPGLGVGVGVPGLGVGAGVPGLGVGAGVPGFGAGADEGVRRSLSPELREGDP

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed its a polypeptide encoded by the polynucleotide or its patrial peptide, an antibody binding to the polypeptide or peptide or its patrial peptide, immunologically assaying the polypeptide or peptide of the polynucleotide by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polynucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotide. The polynucleotide and encoded proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related confines for regulation of their expression and activity, or as targets effect the pense may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell capacity and genes related proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes. transcription related proteins, disease-related proteins and genes conciding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The CDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the Claim 1; Page; 222pp; English

The present sequence represents a human elastin. Peptides derived from elastin are used in compositions of the invention. The specification describes elastin based compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprising inhibiting the proliferation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cells in vivo, regulating the migration of smooth muscle cells in vivo. The compositions may be used for the prophylaxis or treatment of a disorder characterized by diminished capacity to regulate smooth muscle cell function such as

The present sequence represents a fusion protein, comprising human elastin and c-myc, preceded by a His tag. The protein is used in compositions that are potent regulators of smooth muscle cell compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins of ragments of them) which have biological activities comprising: inhibiting the proliferation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cell in vivo; and regulating the migration of smooth muscle cell in vivo; and regulating the differentiation of smooth muscle cell in vivo; and regulating the differentiation of smooth muscle cell functions may be used the prophylaxis or treatment of a disorder characterized by attentions, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated and and and and and and activity or dissection.

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, ancectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, notropic, antipabetic, immunosuppressive, anti-HIV, neuroprotective, notropic, antipatkinsonian, antiasthmatic and preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypotrension, cancer, obesity, diabetes, AIDS, multiple sclerosis graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the mucleic acids may be used as brother and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1;

The invention relates to a derivative or variant of human tropoelastin (ILTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybric proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-products. The hybrid protein have controllable GAG-binding properties, repebulds on presence or absence of a specific fragment, designated tropoelastin derivative SHELGamma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tropoelastin, hTE; elastin; glycosaminoglycan; GAG-binding; medical;
